Business Insights & Final Summary

Business Insights

Insight 1

- **Finding:** Business Class passengers report significantly higher overall satisfaction compared to Economy Class passengers.
- **Evidence:** Satisfaction among Business Class passengers is over 68%, whereas Economy (Eco/Eco Plus) satisfaction ranges between 18%–25%.
- **Business Implication:** Service investments in Economy Class (such as seat comfort and inflight Wi-Fi) are critical to closing the satisfaction gap and retaining price-sensitive travelers.

Insight 2

- **Finding:** Departure delays have a direct negative impact on passenger satisfaction ratings across all segments.
- **Evidence:** Passengers on non-delayed flights report a satisfaction rate of ~48%, which drops significantly to under 38% when flights experience a departure delay greater than 0 minutes.
- **Business Implication:** Ground operations and turnaround times must be optimized to prevent cascade delays, as operational punctuality is a primary driver of customer sentiment.

Insight 3

- **Finding:** Inflight Wi-Fi and Ease of Online Booking receive consistently lower average ratings compared to operational services like Baggage Handling and Inflight Service.
- **Evidence:** Digital touchpoints average between 2.7–2.8 out of 5, while operational services consistently score above 3.6 out of 5.
- **Business Implication:** The airline's digital infrastructure requires modernization. Upgrading inflight Wi-Fi reliability and streamlining the online booking portal will yield high return on passenger satisfaction.

Insight 4

- **Finding:** Disloyal customers exhibit substantially lower satisfaction levels and are more sensitive to service disruptions than Loyal Customers.
- **Evidence:** Disloyal customer satisfaction averages below 25%, compared to over 48% for Loyal Customers.
- **Business Implication:** First-time or occasional travelers need better onboarding and service touchpoints to build brand affinity and convert them into repeat, loyal passengers.

Insight 5

- **Finding:** Flight distance correlates strongly with passenger class, as long-haul flights are heavily dominated by Business Class passengers.
- **Evidence:** Business Class records an average flight distance exceeding 1,500 miles, compared to under 800 miles for Eco Class.
- **Business Implication:** Long-haul routes should remain the focus for premium product enhancements (e.g., lie-flat seats, premium dining), as passengers spending more time in the air place higher value on comfort.

Final Business Summary

An analysis of passenger profiles and operational metrics highlights key operational strengths and immediate strategic opportunities for management. The dataset reveals a balanced age demographic, with middle-aged travelers forming the core customer base. Travel class distribution shows higher volume in Economy, yet Business Class delivers dramatically higher satisfaction rates (over 68% vs. under 25% for Eco).

Service-quality ratings indicate strong performance in core ground and cabin operations, such as Baggage Handling and Inflight Service, both scoring above 3.6/5. However, digital touchpoints—specifically Inflight Wi-Fi and Online Booking—underperform with averages below 2.8/5. Operational delays further aggravate customer sentiment, causing a noticeable drop in satisfaction when departure delays occur.

Strategic Considerations for Management:

1. **Digital Infrastructure Investment:** Upgrade inflight Wi-Fi coverage and simplify the online booking user interface to boost baseline satisfaction scores.
2. **Economy Cabin Upgrades:** Implement targeted comfort enhancements in Economy cabins on medium-to-long haul flights to bridge the satisfaction gap with Business Class.
3. **Punctuality & Delay Management:** Streamline turnaround processes to reduce departure delays and deploy proactive notification tools when disruptions are unavoidable.
